

Roll No.: .....

# END SEMESTER EXAMINATION DECEMBER 2025

Name of the Program: B. Tech

Semester: III

Name of the Course: Fundamentals of AI ML

Course Code: TCS 364

Time: 3 Hours

Maximum Marks: 100

Note:

- All questions are compulsory.
- Answer any two sub questions among a, b & c in each main questions
- Total marks in each main question are twenty.
- Each questions carries 20 marks

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |     |

| Q5                      | Attempt any Two (20 Marks)                                                                                                                                                                                                                                                                           | CO5 |
| (a)                     | Explain the process of evaluating a classification model using training-testing data split. Derive and explain the formulas for accuracy, precision, recall, and F1-score, and illustrate their computation using a sample confusion matrix.                                                         | CO5 |
| (b)                     | Discuss the importance of ROC curve and AUC in evaluating machine learning models. Plot a sample ROC curve using given True Positive Rate (TPR) and False Positive Rate (FPR) values, and explain how AUC helps in model comparison.                                                                 | CO6 |
| (c)                     | Explain the K-Means clustering algorithm step by step with a suitable example. Perform one iteration of K-Means on the following data points with $k = 2$ and initial centroids (2, 4) and (6, 8): Data points = {(2,5), (3,4), (5,7), (6,9)}. Show all distance calculations and updated centroids. | CO5 |
